Abstract

The study examined the effect of kohiladi decoction (consisting of tubers of Lasia spinosa, Linn, entire plant of Centella asiatica Linn, seeds of Vigna radiate Linn, bulbs of Allium cepa Linn and dried fish of Katsuwonus pelamis), a decoction frequently recommended for bleeding piles by Sri Lankan traditional and Ayurvedic physicians, on clotting of blood. This was tested both in vitro (using goat blood and human blood) and in vivo (using rats). The results show that 1 mg/ml concentration of decoction prolonged the calcium induced clotting time significantly (goat blood by 55% and human blood by 76%) in in vitro. In contrast, a 380 mg/kg/day dose of decoction had no effect on clotting when given as a single dose but shorten the clotting time when given for 2 or 3 days. The decoction also had moderate antioxidant activity when determined by thiobarbitiuric acid reaction substances assay. It is concluded that kohiladi decoction has anticlotting action in vitro and proclotting activity in vivo.

Key words: kohiladi decoction, clotting, anticlotting, haemorrhoids

1. Introduction

Haemorrhoids is a major affliction that affect the human society. Haemorrhoids occur in about half the population over 50 years and men are more frequently affected than women (Cuschieri et al., 1982). The main symptoms of the haemorrhoids are bleeding, prolapse, discharge and pain (Mann et al., 1997). In Western medicine haemorrhoids are treated by several methods. These include chemotherapy, reduction of sphincteric pressure, fixation treatment and surgical treatment (Cuschieri et al., 1982). In Sri Lanka, in traditional and Ayurvedic medicine application of herbal oils and pastes, chemical cauterization (kshara sutra) and several decoctions are used in the treatment of haemorrhoids (Kumarasingha,
