**Modified histrosalpingography during infertility work up : a randomised controlled clinical trial**

**MD ( Obstetric and Gynecology) - 2004**

**D 1152**

This study compares the modified hysterosalpingography (HSG) using paediatric 8-F Foley catheter with the traditional Leech-Wilkinson metal cannula method during infertility work-up. The foley catheter method appears to cause less pain, less post procedure bleeding and has reduced volume of contrast medium. Metal cannula method was easy to the performer. No significant difference in the duration of procedure.
