Knowledge and attitudes of patients' attending the diabetic Clinic, General Hospital Kandy, about their disease and its control

MSc. (Community Medicine) - 2001

D 1021

Study showed that significant statistical difference on positive attitudes between different sex($p=0.04$). different income group ($p=0.000$) and respondents with family history and without family history of diabetes mellitus ($p=0.003$). But there was no significant statistical difference in median attitudinal scores between age groups, with number of children they have and marital status.
