**Knowledge attitudes and practices of Public Health Midwives in relation to immunization practices that are carried out in Maternal and Child Health Clinics in a defined Health Unit Area.**

**MSc. (Community Medicine) - 1991**

**D 189**

The study revealed that majority of PHMS were without adequate knowledge regarding EPI. They were lacking immunization competency and refresher training regarding EPI. Practices of most of the MCH clinics ( 90 percent) were highly unsatisfactory . Organization of the Clinic, sterilization of the instruments, site and technique of immunization of cold chain, records keeping have been observed to be highly unsatisfactory . Ultimate quality of care was very poor . Most of the PHMS did not have necessary knowledge , attitudes and practices in relation to EPI. Lack of in-service training have been seen as shortcomings.
